HIGHLIGHTS

For the year 2000:

California and United States Comparisons

- California's estimated population was 34,480,000, an increase of 1.6 percent (546,000 persons) over the state's 1999 population. California's population accounted for 12.5 percent of the U.S. population, or one of every eight residents.
- California's 531,285 live births represented 13.1 percent of the provisional count of all live births in the United States, or roughly one of every eight births. California's birth rate (15.4 per 1,000 population) continued to exceed the preliminary U.S. birth rate (14.8 per 1,000 population).
- California's 228,281 deaths accounted for 9.5 percent of the provisional count of all deaths in the United States, or roughly one of every eleven deaths. California's death rate (6.6 per 1,000 population) continued to fall below the provisional U.S. death rate (8.7 per 1,000 population).
- California's infant mortality rate of 5.4 per 1,000 live births was lower than the provisional rate for the United States (6.7).

California's Births

- The number of live births to California residents increased from 518,073 in 1999 to 531,285 (2.6 percent).
- California's birth rate in 2000 was 15.4 births per 1,000 population, an increase of 0.7 percent from the 1999 birth rate of 15.3.
- California's birth rates decreased in 2000 compared with 1999 for mothers ages under 15 - 24 and increased for mothers ages 25 - 44. The rate was unchanged for mothers 45 and over.
- Hispanics had the largest number (257,958) and percentage (48.6 percent) of births among California's race/ethnic groups.

California's Deaths

- The number of deaths to California residents increased 0.1 percent from 227,965 in 1999 to 228,281 in 2000.
- California's 2000 death rate of 6.6 deaths per 1,000 population decreased 1.5 percent from the 1999 death rate of 6.7.

- The three most prevalent causes of death were heart disease, malignant neoplasms, and cerebrovascular disease, which together accounted for 61.2 percent of all deaths in California.
- Death rates decreased in 2000 for five of the leading causes of death and increased for four of the leading causes. The largest percentage decrease in the death rate was in chronic lower respiratory diseases, which decreased by 4.8 percent. The largest increase was in Alzheimer's disease, up 10.0 percent from 1999.
- For the second consecutive year the number of deaths to females (114,276) surpassed the number of deaths to males (114,005).

California's Infant Deaths

- There were 2,884 California infants under the age of one year who died in 2000, an increase of 97 infant deaths (3.5 percent) from 1999.
- California's infant mortality rate was 5.4 infant deaths per 1,000 live births. This rate was unchanged from 1999.

ACKNOWLEDGEMENTS

Assistance in the preparation of this report was provided by Kamal Bindra and Kathy Riedmiller of the Department of Health Services, Vital Statistics Section. Appreciation is extended to the staff in the Operations Section of the Department of Health Services, Office of Vital Records who registered the vital event records that were used in preparing this report. Staff in the Department of Health Services, Information Technology Services Division also contributed to this report through their work in preparing California's automated birth and death files. Appreciation is also extended to Mary Heim in the Demographic Research Unit of the Department of Finance who provided the population data.

INTRODUCTION

This report is the first of two annual vital statistics reports prepared by the Vital Statistics Section of the Department of Health Services, Center for Health Statistics. This report is an advance report containing final counts of California's 2000 vital events summarized for the State and counties. The purpose of this report is to provide early access to California's summary vital statistics data. Several months following the publication of this advance report, a second, more comprehensive and detailed annual report, Vital Statistics of California 2000, will be published. In addition, tables of 2000 vital statistics data are also available on the Department of Health Services, Center for Health Statistics website (www.dhs.ca.gov/hisp/chs/chsindex.htm).

Data contained in this report are presented on the number and rate of live births, deaths, fetal deaths, and infant deaths for the State, counties, and three city health departments. Age, race, and sex-specific data on births and deaths are also presented for the State, counties, and three city health departments. Limited trend data are presented for the State and, where appropriate, comparative data for the United States are included.

Data on race and ethnicity in this report differ from previous reports. As of January 2000, California birth and death certificates permitted assignment of up to three races of mother, father, and decedent. Most of the tables in this report present race data with a "two or more" category that consists of all respondents who were reported with two or three distinct races. Please see the Technical Notes for more information.

Population data used in this report were from the following Department of Finance reports: Report E-2, County Population Estimates and Components of Change, 1999-2000 with Historical Estimates, 1990-1999, May 2001; Report E-1 City/County Population Estimates with Annual Percent Change, May 2001; Population Estimates by Age, Race/Ethnicity and Sex, May 2000; and Population Projections By Age, Race/Ethnicity, and Sex, 1970-2040, December 1998. Please refer to each table for the source of population estimates and projections. The population projections are shown in Appendix A.

The cause of death codes used in this report (Table 12) are from the Tenth Revision of the International Classification of Diseases (ICD-10). Causes of death in this report will not be comparable with similar causes in reports prior to 1999.

The sources of the vital statistics data presented in this report are California's birth, death and fetal death certificates registered by the Office of Vital Records. The population data used in preparing this report were obtained from the Demographic Research Unit in the California Department of Finance.

At the end of this report is a discussion of some of the limitations involved in using the data contained in this report, and definitions of key terms. A more complete discussion of these and other important issues concerning the use of California's vital events are included in Vital Statistics of California 1999.

In addition to this advance report and the annual Vital Statistics of California, the Department of Health Services, Center for Health Statistics prepares a number of other reports. These provide more detailed data on particular vital statistics topics, such as trends in cesarean births or specific causes of death. Information concerning these reports is available in the Catalog of Data Products and Publications prepared by the Center. Copies of this catalog can be obtained on the Internet (see address below) or by calling (916) 445-6355, or by writing to the Department of Health Services, Center for Health Statistics, Office of Health Information and Research, 304 S Street, Third Floor, Sacramento, California, 95814. On-line versions of many reports including this one, and a large number of additional data tables can also be accessed through the Department of Health Services, Center for Health Statistics website at: www://dhs.ca.gov/hisp/chs/chsindex.htm.

SECTION I

STATE AND COUNTY VITAL STATISTICS SUMMARY

Presented in **Table 1** are summary vital statistics data on California's population, live births, deaths, fetal deaths, and infant deaths from 1980 - 2000. Similar data for 2000 are presented for each of California's 58 counties in **Table 2** and for three city health departments in **Table 2A**.

Population

The estimated population of California in 2000 was 34,480,000, an increase of 546,000 individuals (1.6 percent) over the state's population in 1999 (**Table 1**).¹ California's population accounted for 12.5 percent of the total U. S. population, or one of every eight U.S. residents.²

As shown in **Table 2**, the respective populations of California's counties in 2000 ranged from a high of 9,716,100 in Los Angeles to a low of 1,220 in Alpine. Over one-fourth (28.2 percent) of California's total population resided in Los Angeles County. In addition, the combined populations of counties having a population of over one million (Alameda, Los Angeles, Orange, Riverside, Sacramento, San Bernardino, San Diego and Santa Clara) accounted for over two-thirds (67.3 percent) of the State's population.

Live Births

There were 531,285 live births among California residents in 2000, an increase of 13,212 births (2.6 percent) from 1999. As shown in **Table 1**, this was the first increase in the total number of live births for the State after nine years of decreases. In 2000, California's live births represented 13.1 percent of all provisional U.S. live births, or approximately one of every eight births.²

As shown in **Table 2**, the number of live births in 2000 among the residents of California's 58 counties ranged from a high of 157,391 in Los Angeles to a low of 9 in Alpine. Nearly one-third of California's births were to Los Angeles County residents.

Birth Rate

After steadily declining since 1990, California's birth rate increased in 2000. The 2000 birth rate per 1,000 population was 15.4, an increase of 0.7 percent from the 1999 rate of 15.3 and a decrease of 23.0 percent from the 1990 rate of 20.0 (**Table 1 and Figure 1**). California's birth rate in 2000 was higher than the preliminary rate for the United States, 15.4 compared with 14.8, continuing a consistent trend extending back many years.^{2,3}

Birth rates among California's counties in 2000 ranged from a high of 19.3 in Tulare County with a low of 5.8 in Sierra County (**Table 2**).

Deaths

There were 228,281 deaths among California residents in 2000, an increase of 316 deaths (0.1 percent) from 1999. As shown in **Table 1**, this was the fourth increase after two consecutive years of decreases in the total number of deaths for the State. In 2000, California's deaths represented 9.5 percent of all provisional U.S. deaths, approximately one of every eleven deaths.

As shown in **Table 2**, the number of deaths in 2000 among the residents of California's counties ranged from a high of 59,032 in Los Angeles to a low of 6 in Alpine. Over one-fourth (25.9 percent) of California's deaths were among Los Angeles County residents.

Death Rate

California's 2000 death rate of 6.6 per 1,000 population was 1.5 percent lower than the 1999 rate of 6.7 (**Table 1 and Figure 1**).

California's death rate in 2000 was lower than the provisional death rate for the United States as a whole, 6.6 compared to 8.7, a pattern that has remained unchanged for many years.^{2,3}

Among California's counties, the death rate in 2000 ranged from a high of 14.0 in Lake County to a low of 3.7 in Mono County. Many factors affected the variation in county crude death rates shown in **Table 2**, particularly the different age distributions associated with the respective populations of each county. For purposes of comparing death rates among county populations, it is preferable to use age-adjusted death rates rather than crude rates shown in **Table 2**. Other reports prepared by the Department of Health Services contain age-adjusted death rates by county.^{4,5}

Fetal Deaths and Fetal Death Ratio

In 2000, there were 3,046 fetal deaths among California's residents, an increase of 119 fetal deaths (4.1 percent) from 1999 (**Table 1**). The 2000 fetal death ratio for California was 5.7 fetal deaths per 1,000 live births.

Infant Deaths

There were 2,884 infant deaths among California's residents in 2000, an increase of 97 infant deaths (3.5 percent) from 1999. As shown in **Table 1**, this was the first increase after ten consecutive years of decreases. In 2000, California's infant deaths represented 10.6 percent of all provisional U.S. infant deaths, or approximately one of every ten infant deaths.²

Infant Mortality Rate

In 2000, California's infant mortality rate per 1,000 live births was 5.4 and was unchanged from 1999 (**Table 1 and Figure 1**). This was the lowest infant mortality rate ever recorded for the state.

California's infant mortality rate in 2000 was lower than the provisional infant mortality rate for the United States as a whole, 5.4 compared

to 6.7.² California's infant mortality rate has consistently fallen below the U.S. rate.

Infant mortality rates in 2000 for most of California's counties are shown in **Table 2**. The small number in many of the smaller counties prevents the calculation of reliable infant mortality rates. Among those counties with infant mortality rates that were calculated, the rates varied from a high of 9.5 in Yuba County to a low of 3.5 in Marin County. Even in some of the medium and large counties, the infant mortality rate can vary significantly from year to year. For a more reliable assessment of infant mortality rates by county, infant mortality rates for several years should be examined. Other reports by the Department of Health Services contain trend data relating to county infant death rates.⁶

FIGURE 1
VITAL STATISTICS RATES/RATIO
CALIFORNIA, 1980-2000

Live birth and death rates are per 1,000 population.
Infant death rates and fetal death ratios are per 1,000 live births.

Births, Deaths, Fetal Deaths and Infant Deaths by City Health Department

Table 2A shows the numbers and rates for three city health departments within their respective counties. Berkeley residents had 4.3 percent (946 births) of the 22,164 live births in Alameda County, and showed a birth rate of 9.1. Of the 157,391 births in Los Angeles County, Long Beach had 8,409 births (5.3 percent) with a birth rate of 18.0 and Pasadena had 2,327 births (1.5 percent) with a birth rate of 17.2.

Berkeley residents accounted for 629 of the 9,841 total deaths in Alameda County (6.4 percent) with a death rate of 6.1. Long Beach accounted for 5.5 percent (3,261 deaths) of the total deaths in Los Angeles County, while Pasadena accounted for 2.1 percent (1,214 deaths). The death rates for Long Beach and Pasadena were 7.0 and 9.0, respectively.

Berkeley had 6 fetal deaths in 2000, 4.4 percent of the 136 fetal deaths in Alameda County. Of the 974 fetal deaths in Los Angeles County, Long Beach had 52 (5.3 percent) and Pasadena had 10 (1.0 percent) with fetal death ratios of 6.2 and 4.3, respectively.

There was one infant death in Berkeley in 2000, 1.0 percent of the 103 infant deaths in Alameda County. Los Angeles County had 777 infant deaths in 2000 and of those 56 (7.2 percent) were in Long Beach and 17 (2.2 percent) were in Pasadena. The infant mortality rates for Long Beach and Pasadena were 6.7 and 7.3 respectively.

- Represents zero events.

^a Rates and ratios are not calculated for fewer than five events.

^b Fetal death ratios and infant mortality rates are not calculated for counties reporting fewer than 1,000 births.

Note: Live birth and death rates are per 1,000 population. Fetal death ratios and infant mortality rates are per 1,000 live births.

Fetal deaths include only those with a stated or presumed period of gestation of 20 weeks or more. Infant deaths are those under one year of age.

County population will not add to total due to rounding.

SECTION II

LIVE BIRTHS

Presented in **Table 3** through **Table 11** are 2000 data on live births for California, each county, and three city health departments by mother's age, mother's race/ethnicity, infant's birthweight, and trimester prenatal care began.

Live Births by Mother's Age

Table 3 shows the number of births grouped by mother's age for the years 1996-2000. During this time period, the number of births to mothers in the age groups of under 15 through 19 declined, while births to mothers aged 35 and over increased. The largest percentage decrease in the number of live births between 1999 and 2000 was among mothers aged under 15 (-13.8 percent), while the largest percentage increase was among mothers aged 40-44 (9.4 percent).

Mothers aged 25-29 continued to have the largest number of births, followed by 30-34 and 20-24 year-old mothers. These three age groups combined accounted for 73.4 percent of all births in 2000. The percentage of teen births (mothers under the age of 20) among all births decreased to 10.6 percent from 11.1 percent in 1999. Women 35 and over accounted for 16.0 percent of all births in 2000, up from 15.6 percent in 1999 and 14.1 percent in 1996.

The number of live births in 2000 by mother's age for each county and three city health departments is shown in **Table 4**. Cross-county comparisons of births by mother's age, e.g., percent of teen births, should include more than a single year of data. Other reports from the Department of Health Services provide these types of analyses.⁴

Birth Rates by Mother's Age

Also shown in **Table 3** are the birth rates by mother's age for the years 1996 through 2000, and the changes in these rates between 1999 and 2000. **Figure 2** shows these rates graphically for the age groups of 15-19 through 40-44.

The number of births per 1,000 women aged 15 through 44 (known as the general fertility rate) increased from 70.5 in 1999 to 71.9 in 2000, an increase of 2.0 percent, and a decrease of 3.7 percent from the 1996 rate of 74.7. The birth rate went down in 2000 compared with 1999 in the age groups of under 15 through 20-24. The birth rate increased for mothers aged 25-29 through 40-44. For mothers aged 45 and over, the rate was unchanged from 1999. The largest percentage increase in the birth rate was among mothers aged 40-44 (7.7 percent). Mothers aged under 15 had the largest decrease (-22.2 percent).

FIGURE 2
BIRTH RATES BY AGE OF MOTHER
CALIFORNIA, 1996-2000

Rates are per 1,000 females in specified age groups.
Source: Department of Health Services Birth Records.

Live Births by Mother's Race/Ethnicity

Race and ethnicity data in this report differ from previous reports. Beginning in 2000, race

reporting changed to allow parents to report up to three races on their child's birth certificates. In 2000, 1.9 percent of California resident births (9,870 births) were reported as being to mothers of more than one race. In order to simulate comparability of race/ethnic data for **Table 5**, mothers who reported two or more races were allocated to their first mentioned race on the birth certificates. Other tables in this section report these mothers in a "two or more races" category.

In 2000, among the race/ethnic groups shown in **Table 5**, Hispanic mothers accounted for the largest number of births with 257,958 or 48.6 percent of all births. White mothers accounted for 32.8 percent (174,490 births) of all births. American Indians had the lowest number of births with 2,240 (0.4 percent).

The 2000 data by race/ethnicity is not precisely comparable to earlier years. The percent changes in live births from 1999 and 2000, shown in **Table 5** are at least partly the result of the change in reporting rather than the actual year-to-year change.

The number of live births in 2000 by mother's race/ethnicity for each county and three city health departments is shown in **Table 6**. This table also shows the number of births for which two or more races were reported.

Birth Rates by Mother's Race/Ethnicity

Hispanics had the highest birth rate of any race/ethnic group shown (**Table 5**). Their 2000 birth rate of 24.1 births per 1,000 population was 67.4 percent higher than among Blacks (14.4) and 53.5 percent higher than among Asian/Pacific Islanders (15.7). The birth rate for Whites was the lowest (10.0) followed by the rate among American Indians (10.9). Again, percent changes from 1999 race-specific rates are confounded by changes in race reporting methods.

Live Births by Mother's Age and Race/Ethnicity

Table 7 shows the number of live births in 2000 by both mother's age and race/ethnicity. The

highest percentage of births to mothers under 20 was to American Indian and Black mothers with 16.2 and 15.3 percent respectively. Asian mothers had the lowest percentage of births to mothers under age 20 with 3.6 percent. Of the mothers aged 40 and over, mothers of the White race/ethnic group had the highest percentage of births with 4.6 percent.

Live Births by Birthweight and Mother's Race/Ethnicity

Table 8 shows the number and percent of live births in 2000 by birthweight and race/ethnicity of mother. Among all births in 2000, 32,853 (6.2 percent) weighed less than 2500 grams. Black mothers had the highest percentage of low birthweight infants (11.8 percent), and Hispanic and Pacific Islander mothers had the lowest (5.6 percent).

Numbers of live births in 2000 by birthweight are shown for each county and three city health departments in **Table 9**. Comparisons of low birthweight infants among counties should include more than a single year of data and are contained in other reports from the Department of Health Services.⁴

Live Births by Trimester Prenatal Care Began and Race/Ethnicity of Mother

Table 10 shows the number and percent of live births by trimester prenatal care began and race/ethnicity of mother. In 2000, mothers who received early prenatal care (care beginning in the first trimester) accounted for 441,712 births. The percentage of mothers who received early prenatal care ranged from a high of 90 percent among White mothers to a low of 69 percent among Pacific Islander mothers.

Mothers who received no prenatal care in 2000 (3,180 births) accounted for 0.6 percent of the total births. The percentage of mothers who received no prenatal care ranged from a high of 2.4 percent for Pacific Islander mothers to none for mothers of the Other race group.

Table 11 shows numbers of births in 2000, by the trimester in which prenatal care began, for each county and city health department.

Comparisons of percentages of mothers who received early or no prenatal care among counties should include more than a single year of data and are included in other reports from the Department of Health Services.⁴

WHITE ²	10.9	10.5	10.4	10.1	10.0	-1.0

¹ American Indian, Asian/Pacific Islander, Black, and White exclude Hispanic ethnicity.
Hispanic includes any race category.

* Beginning in 2000, up to three races were reported on birth certificates. The race categories on this table were generated from the first mentioned race or Hawaiian (if Hawaiian was second or third).
Trends should be viewed with caution. See technical notes.

² Includes White, Other, and Unknown.

³ Rates are per 1,000 population.

- Rate unchanged from prior year.

Note: Population data are available for only these five race/ethnic groups.

Rates in this report may differ from rates in previously published Advance Reports since rates were revised to reflect the most current population released by the Department of Finance.

Source: State of California, Department of Finance; 1996 Population: 1970-1996 Population Estimates with Age, Sex and Race/Ethnic Detail, January 1998. 1997 Population: Population Estimates with Age, Sex and Race/Ethnic Detail, June 1999. 1998 Population: Population Estimates by Age, Sex and Race/Ethnic Detail, May 2000. 1999 - 2000 Population: 1997-2040 Population Projections with Age, Sex and Race/Ethnic Detail, December 1998.

SECTION III

DEATHS

Table 12 through **Table 17** present data on deaths in 2000 for California and for each of the 58 counties and three city health departments detailed by the ten leading causes of death, age, sex, and race/ethnicity.

Ten Leading Causes of Death

In 2000, heart disease, malignant neoplasms, and cerebrovascular disease remained the first, second, and third leading causes of death, and accounted for 61.2 percent of all deaths (**Table 12**). The ten leading causes were the same in 2000 as they were in 1999.

Six of the leading causes of death in **Table 12** were the same rank for both California residents and residents of the United States.⁷ Two of the remaining four leading causes were the same as the United States but the rank ordering differed. Chronic liver disease and cirrhosis and suicide ranked ninth and tenth for California but were not among the ten leading causes for the United States.

Between 1999 and 2000, seven of the ten leading causes of death increased in number (malignant neoplasms, stroke, influenza and pneumonia, diabetes, Alzheimer's, chronic liver disease and cirrhosis, and intentional self-harm) and three decreased (heart disease, chronic lower respiratory disease (CLRD), and accidents). Alzheimer's had the largest increase in the number of deaths, increasing 11.8 percent from 1999 to 2000. The largest decrease was for CLRD dropping 3.3 percent from 1999.

Table 12 also shows death rates for each of the ten leading causes of death. Death rates for five of the ten leading causes of death decreased from 1999 to 2000, four increased and one was unchanged. The largest decrease in the death rate among the ten leading causes of death was deaths due to CLRD (-4.8 percent). The largest increase in the death rate was due to Alzheimer's Disease (10.0 percent).

FIGURE 4
DEATH RATES FOR TEN LEADING CAUSES
CALIFORNIA AND U.S. , 2000

Rates are per 100,000 population.

Source: National Vital Statistics Reports, Deaths : Preliminary Data for 2000. Department of Health Services Death Records.

Death rates in 2000 were lower for Californians compared to the preliminary U.S. population report for the same period for nine of the ten leading causes. The death rate was higher in California than the United States for one cause - chronic liver disease and cirrhosis, 10.7 compared to 9.5 (**Table 12 and Figure 4**).

Cause-specific death rates for California's counties are not included in this report since they should be calculated using more than a single year of data. Three-year average, cause-specific death rates are available in other Department of Health Services reports.^{4,5}

Deaths by Age and Sex

In 2000, the total number of deaths to females surpassed the total number of deaths to males (114,276 and 114,005 respectively). This was the second consecutive year that the number of female deaths was higher than the number of male deaths.⁸ **Figure 5** shows the number of deaths by sex for the years 1996-2000. Within this time period, the number of female deaths increased 5.4 percent (5,841 deaths), while the number of male deaths increased 0.1 percent (132 deaths). Between 1999 and 2000 the total number of deaths increased for males (0.3 percent) and decreased for females (-0.1 percent), although the percentage changes varied by age group.

FIGURE 5
NUMBER OF DEATHS BY SEX
CALIFORNIA, 1996 - 2000

Source: State of California, Department of Health Services, Death Records.

Table 13 shows that for males between 1999 and 2000, there were decreases in the number of deaths in the age groups 25-44 and 65-84. The largest percentage decrease was in the age group of 65-74, down 3.7 percent. The number of deaths increased for males in the age groups of under 1-24, 45-64, and 85 and over. The largest increase for males was in the 5-14 age group (8.0 percent). For females, there were increases in all age groups with the exception of the age groups 1-4, 15-34, and 65-74. The largest increase for females was in the age group of under 1 (5.7 percent). The largest

decrease for females between 1999 and 2000 was in the age group 1-4 (-9.3 percent).

Table 13 also shows the age and sex-specific death rates among Californians between 1999 and 2000. While the overall death rate for females (662.3) was higher than the death rate for males (655.2), death rates were lower for females compared to males in each age group. Death rates for females decreased between 1999 and 2000 in 9 of the 11 age groups. The largest decrease in the death rate among females was in the age group 1-4 (-9.7 percent). Death rates increased among females in the age groups of under 1 and 35-44 (5.1 and 2.3 percent respectively). For males, death rates decreased in all age groups with the exception of the age groups under 1, 5-14, and 25-34. The death rate for males in the age group of 1-4 was unchanged from 1999. The largest decrease in the death rates for males was in the age group 65-74 (-4.9 percent).

Compared with the preliminary statistics for the United States, as a whole, the overall death rates in 2000 were lower for California's males (655.2 compared to 874.8 deaths per 100,000 males) and females (662.3 compared to 872.3 deaths per 100,000 females).⁷

Table 14 shows the number of deaths in 2000 by age group for each California county and three city health departments. Age-specific rates by county should be calculated by using more than a single year of data and are available in other Department of Health Services reports.⁴

Deaths by Race/Ethnicity

Beginning in 2000, race reporting changed to allow for the reporting of up to three races on death certificates. In 2000, 0.2 percent or 516 deaths to California residents were reported as being multi-race. In order to simulate comparability of race/ethnicity for Table 15, multi-racial decedents were allocated to the first mentioned race on their death certificate. Other tables in this section report these deaths in a "two or more races" category. Trends should be viewed with caution.

Table 15 shows the numbers and rates of death by race/ethnicity for Californians from 1996 through 2000. Whites accounted for the largest number of deaths in each of the five years shown (73.0 percent in 2000).

In 2000, Whites also had the highest death rate of the five race/ethnic groups shown (9.6 deaths per 1,000 population) followed by Blacks (7.5). Hispanics had the lowest death rate with 2.7.

The relatively low death rates among California's American Indian, Asian/Pacific Islander, and Hispanic race/ethnic groups is partly due to the manner in which race/ethnicity is reported among these groups.^{9, 10, 11}

The 2000 race/ethnicity data are not strictly comparable to earlier years. The percent changes shown in **Table 15** may be primarily the result of the change in reporting rather than the actual year to year change. The American Indian group was especially affected by this change.

Table 16 shows the number of deaths in 2000 by race/ethnicity for each California county and three city health departments. This table and in **Table 17** deaths to persons of two or more races are reported separately.

Deaths by Race/Ethnicity, Age, and Sex

Table 17 shows numbers of deaths by race/ethnicity, age, and sex for California in 2000.

¹ Includes unknown age.

^a Death rates for "Under 1" are calculated using population data and differ from the infant death rates shown in Tables 1 & 2 which are calculated using the number of live births.

^{*} Number unchanged from prior year.

Note: Rates are per 100,000 population.

Rates in this report may differ from rates in previously published Advance Reports since rates were revised to reflect the most current population released by the Department of Finance.

AMERICAN INDIAN	3.8 ^a	4.1 ^a	4.0 ^a	3.8 ^a	4.5 ^a	18.4
ASIAN/PACIFIC ISLANDER	3.6 ^a	3.7 ^a	3.6 ^a	3.7 ^a	3.7 ^a	-
BLACK	7.9	7.6	7.5	7.7	7.5	-2.6
WHITE ²	9.6	9.6	9.6	9.6	9.6	-

¹ American Indian, Asian/Pacific Islander, Black and White exclude Hispanic ethnicity. Hispanic includes any race category.

^{*} Beginning in 2000, up to three races were reported on death certificates. The race categories on this table were generated from the first mentioned race or Hawaiian (if Hawaiian was second or third).

Trends should be viewed with caution. See technical notes.

² Includes White, Other and Unknown.

³ Rates are per 1,000 population.

^a Reliability of death rates for Asian/Pacific Islanders, American Indians and Hispanics is questionable due to incorrect reporting of race/ethnicity among these groups.

- Rates unchanged from prior year.

Note: Population data are available for only these five race/ethnic groups.

Rates in this report may differ from rates in previously published Advance Reports since rates were revised to reflect the most current population released by the Department of Finance.

- Represents zero events.

¹ Beginning in 2000, up to three races were reported on death certificates. Comparison with prior years' data should be made with caution, especially for smaller race/ethnic groups.

Hispanic includes any race or races.

APPENDIX B

TECHNICAL NOTES

LIMITATIONS OF DATA

Users must recognize limitations of the data to avoid invalid interpretations. For vital statistics data, limitations are related to the difficulties in reporting and classifying information and to some under-registration of events. It is especially necessary to exercise caution when evaluating vital statistics trend data, because medical concepts, legal codes, definitions concerning vital statistics events, estimates of the population, race coding, and methods of assigning causes of death change over time.

Variability of Rates

Vital statistics rates are sensitive to variations in the size of both the numerator (the number of vital events that occurred) and the denominator (the estimated population at risk). For example, in small counties, a variation of only a few cases in the numerator can cause a relatively large shift in the rate while, in a large county, it may result in no change at all. Likewise, a minor revision in the estimate of the population in a small county may cause a relatively major change in a vital event rate in that county.

Sampling Error and Vital Statistics

The number of births and deaths reported for an area in California represents complete counts; as such, they are not subject to sampling error, although they are subject to errors in the registration process. However, when the figures are used for analytic purposes, such as comparison of rates over a time period or for different areas, the number of events that actually occurred may be considered as one of a larger series of possible results that could have arisen under the same circumstances.¹² The probable range of values may be estimated from the actual figures according to certain statistical assumptions.

The problem of random variation of rates is well presented in the Technical Appendix to The Vital Statistics of the United States, 1978, Volume I, Natality¹³ and is described as follows:

“In general, distributions of vital events may be assumed to follow the binomial distribution. Estimates of standard error and tests of significance under this assumption are described in most standard statistics texts. When the number of events is large, the standard error, expressed as a percent of the number or rate, is usually small.

When the number is small (perhaps less than 100) and the probability of such an event is small, considerable caution must be observed in interpreting the conditions described by the figures. Such events of rare nature may be assumed to follow a Poisson probability distribution.”

Computing Percents

We computed percents used in this report using only events for which the characteristic is reported. We subtracted the “Unknown” category out before computing the percent.

Race/Ethnicity

For the first time in 2000, birth and death data were collected with multiple race reporting capability for mothers and fathers of infants and for decedents. This is consistent with the 2000 census, and is in compliance with the current Office of Management and Budget directive on collection of race and Hispanic data.

We used the following race/ethnic categories and their definitions in this report:

American Indian – includes American Indian, Eskimo, and Aleut.

Asian – includes Chinese, Japanese, Korean, Vietnamese, Cambodian, Thai, Laotian, Hmong, Asian Indian, Filipino, Asian Unspecified, and Asian Specified.

Black – includes Black and African American.

Pacific Islander – includes Guamanian, Hawaiian, Samoan, and Other Pacific Islander.

White – includes White.

Other – includes Other Specified.

Unknown – includes Refused to State and Unknown.

Two or More – includes any two or more unique mentions of races above.

Hispanic – includes Mexican/Mexican American/Chicano, Puerto Rican, Cuban, Central/South American, other Spanish/Hispanic (born outside the United States), Other Spanish/Hispanic (born in the United States).

For purposes of presenting race/ethnic groups that are mutually exclusive, all persons who indicated they were of Spanish origin were included in the “Hispanic” group regardless of their race or races. All remaining non-Hispanic persons were included in their respective race group, i.e. American Indian, Asian, Black, Pacific Islander, White, Two or More, and Other.

At the time of preparation of this report, data from the 2000 census was not yet available. Therefore, tables which include race-specific rates were prepared by using the first mentioned race. (To be consistent with bridging methodologies used by NCHS for California, 2000 data, Hawaiian was listed as the first mentioned race even if it was mentioned second or third on the certificate).

Population

The Department of Finance (DOF) prepared the population data used as denominators for

calculating rates in this report. At the time of preparation of this report, population data based on 2000 census were not available by sex, age, and race. Therefore 2000 rates are based on the DOF population projections for the years 1997 through 2040. The 1997 population estimates were released in June of 1999 and the 1998 estimates were released in May 2000. We calculated rates in this report using the population estimates for the years 1980 through 1998 and the population projections for 1999 and 2000. Refer to the footnotes on each table for the source of population estimates and projections.

In addition, the population series used to calculate the crude rates in **Table 2A** differs from the population used to calculate the crude rates in **Table 2**. Caution should be exercised when comparing the crude rates among the three city health departments with rates among the 58 counties.

Cause of Death Coding

The classification of diseases has been revised periodically. Beginning with the 1999 death data, the cause of death coding system has changed from the Ninth Revision of the International Classification of Diseases (ICD-9) to the Tenth Revision (ICD-10). This resulted in a “break in the series” of comparability of cause of death statistics. Cause of death from 1998 and earlier should therefore not be compared with 1999 and subsequent data. Two-year comparisons of cause of death data based on ICD-10 are available for the first time in this report.

For more information, see the National Center for Health Statistics (NCHS) web page at: www.cdc.gov/nchs/about/major/dvs/icd10des.htm

APPENDIX C

DEFINITIONS

The following is a Glossary of technical terms used in this report:

Place of occurrence: The place where the event occurred (regardless of place of residence).

Place of residence: The place where a person lives or maintains legal residency. For live births and fetal deaths, the mother's residence is used.

Births

Live Birth: "Live birth is the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of the pregnancy, which, after such separation, breathes or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles, whether or not the umbilical cord has been cut or placenta is attached; each product of such a birth is considered live born." This definition was promulgated by the World Health Organization in 1950 and is set forth in the California Administrative Code, Title 17, Chapter 1, Article 3.

Low Birthweight: A live birth weighing less than 2,500 grams (5 pounds, 8 ounces).

Deaths

Fetal death: "Fetal death is death prior to the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of pregnancy; the death is indicated by the fact that after such separation the fetus does not breathe or show any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles." This definition was promulgated by the World Health Organization in 1950 and is set forth in the California Administrative code, Title 17, Chapter 1, Article 3. If fetus is 20 weeks or more gestational age, the death must be registered with the local registrar.

Infant death: A death occurring during the first year of life.

APPENDIX D

RATES AND RATIO

Birth Rates

$$\text{Age-specific birth rate} = \frac{\text{number of live births to women in specific age group}}{\text{estimated female population in that age group}} \times 1,000$$

$$\text{General fertility rate} = \frac{\text{number of live births}}{\text{estimated female population 15-44 years old}} \times 1,000$$

$$\text{Live birth rate (crude birth rate)} = \frac{\text{number of live births}}{\text{estimated total population}} \times 1,000$$

Death Rates and Ratio

$$\text{Age-specific death rate} = \frac{\text{number of deaths in specific age group}}{\text{estimated population in that age group}} \times 100,000$$

$$\text{Death rate (crude death rate)} = \frac{\text{number of deaths}}{\text{estimated total population}} \times 1,000$$

$$\text{Death rate from a specific cause} = \frac{\text{number of deaths from a specific cause}}{\text{estimated total population}} \times 100,000$$

$$\text{Fetal death ratio} = \frac{\text{number of reportable fetal deaths}}{\text{total number of live births}} \times 1,000$$

$$\text{Infant mortality rate} = \frac{\text{number of deaths under 1 year of age}}{\text{total number of live births}} \times 1,000$$
